

Part 5: Personality & technical Questions

Please answer truthfully so that we can assign tasks accordingly to your workflow. There is no right and wrong answer for these.

1. What are the most difficult technical problems in your work experience you have encountered and how do you fix them?

One of the toughest challenges I faced was building a creative, interactive UI with advanced animations and dynamic elements while ensuring it was responsive and accessible. I used tools like Framer Motion for animations and TailwindCSS for responsiveness. For unique features, I wrote custom CSS and JavaScript. Regular feedback and performance optimization ensured the final product was visually stunning, user-friendly, and fast across all devices.

2. When you're working on a project, how do you typically approach it from start to finish?

When working on a project, I start by understanding the requirements and defining the main goals. Once I have a clear picture, I create a plan by breaking the project into smaller, manageable tasks. I then work step-by-step, starting with the foundation and gradually adding features or components. Throughout the process, I test frequently to ensure everything functions as expected. After completing the core work, I gather feedback to identify any necessary improvements or adjustments. Finally, I polish the project to ensure it meets the requirements and is ready for use or deployment.

3. How do you usually approach learning a new topic to absorb as much as possible?

When I want to learn a new topic, I start by thoroughly researching it across various reliable websites. I explore how different people or professionals approach and apply the topic in real-world scenarios. This helps me gain a broader perspective and understand its practical usage. After gathering enough information, I take notes and try to summarize the key points to reinforce my understanding.

4. "Consistency" vs "fast & efficient". Choose one.

I would choose consistency because it ensures reliability and long-term success. While it can be more challenging to maintain, consistent efforts lead to steady progress and better results over time. On the other hand, "fast and efficient" approaches, though tempting, can often lack stability and lead to inconsistent outcomes, which might not be sustainable in the long run.

5. Do you own any Apple products? Like IMac, Macbook, Ipad, Iphone, etc...

I don't currently own any Apple products, but if a situation arises where I need to have one, I would definitely consider purchasing it.

6. What is your immediate availability to start this job?

I am available to start this job in 30 days
